                                                                                                                                                                             The present sequence represents a fragment of open reading frame 7 (ORF7), bases 14659.14686, of the Lelystad isolate of Porcine reproductive and respiratory syndrome virus (PRRSV). The present sequence is highly conserved in PRRSV isolates, and is essential for RNA replication. PRRSV is an Arterivirus. The specification describes an Arterivirus replication having some of its original arteriviral nucleic acid encoding ORFX deleted. The replicon is still capable of in vivo RNA replication, even when further comprising nucleic acid derived from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Recombinant swine:pox virus contg. foreign DNA sequence - useful for delivery of vaccinating antigens or other therapeutic agents to humans or
                                                                              Arterivirus replicon for obtaining a vaccine useful against porcine reproductive and respiratory syndrome virus, comprises deletions in some of its original arteriviral nucleic acids encoding open reading frame-7.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Swinepox virus; viral vector; homology vector; vaccine; antigen; tumour; cytokine; immune response; feline immunodeficiency virus infection; heartworm; ss; PCR; primer.
                                                                                                                                                                                                                                                                                                                another heterologous microorganism, thereby providing viable Arteriviruses with deletions proximal to the 3' end of the genome. The replicon is useful in obtaining a vaccine. The vaccine is used in vaccinating animals, preferably pigs susceptible to PRRSV

The invention relates to a new recombinant swinepox virus (SPV)

comprising, inserted into a HindIII M, N or K fragment of the SPV genome,
a foreign DNA sequence that can be expressed in a SPV-infected host cell.
Also new are homology vectors for production of recombinant SPV

comprising double-stranded foreign sequence with, on both sides, doublestranded SPV DNA homologues to the viral genome on either side of the
HindIII N fragment. The recombinant SPV are vectors for delivering

vaccinating antigens or therapeutic agents to humans, other mammals or

configuration of the stranded spy encode an antigen from an infectious
agent or tumour, or a cytokine to stimulate an immune response. SPV can
also be used as diagnostic reagents, e.g. to detect feline
immunodeficiency virus of D. immitis (heartworm) infection. SPV is only
weakly pathogenic, species specific and induces an immune response. The
present sequence is a PCR primer amplifying a foreign DNA sequence that Sequence 38 BP; 15 A; 9 C; 7 G; 7 T; 0 U; 0 Other;

Recombinant swine pox virus - useful in vaccine for immunising animal against swine pox virus.

Example 44; Page 244; 473pp; English.

The present sequence represents a PCR primer used in an example from the present invention. The present invention specifically describes recombinant swinepox virus (SPV) comprising a foreign DNA (I) inserted into a SPV genome which is capable of being expressed in a host cell into which the virus is introduced, where (I) is inserted into: (a) an BCORI site within a region corresponding to a 3.2 kb subfragment of the HindIII k fragment which contains both a HindIII and an EcoRI site, of the SPV genome, and optionally (b) an ACCI site within a region corresponding to a 3.6 kb HindIII to BglII subfragment of the HindIII w fragment. The recombinant SPV can be used in a vaccine for immunising an animal against

SPV. The invention also provides a method for testing a swine to determine whether the swine has been vaccinated with the vaccine, particularly containing S-SPV-008, or is infected with a naturally occurring wild-type pseudorabies virus. Also (I) inserted into recombinant SPV can be used in a diagnostic assay, e.g. Feline immunodeficiency virus (FIV) env and gag genes and Dirofilaria immitis p39 and 22kd are useful to detect feline immunodeficiency caused by FIV and to detect heartworm caused by D. immitis respectively 8888888888888

Recombinant swine pox virus - useful in vaccine for immunising animal against swine pox virus.

Example 36; Page 154; 473pp; English.

The present sequence represents a PCR primer used in an example from the present invention. The present invention specifically describes recombinant swinepox virus (SPV) comprising a foreign DNA (1) inserted into a SPV genome which is capable of being expressed in a host cell into a sPV genome which is capable of being expressed in a host cell into which the virus is introduced, where (I) is inserted into: (a) an BCORI site within a region corresponding to a 3.2 Mb subfragment of the HindIII R fragment which contains both a HindIII and an BCORI site, of the SPV genome, and optionally (B) an AcrI site within a region corresponding to a 3.6 Kb HindIII to Bgill subfragment of the HindIII M fragment. The recombinant SPV can be used in a vaccine for immunising an animal against SPV. The invention also provides a method for testing a swine to determine whether the swine has been vaccinated with the vaccine, particularly containing S-SPV-008, or is infected with a naturally cocurring wild-type pseudorables virus. Also (I) inserted into recombinant SPV can be used in a diagnostic assay, e.g. Peline immunodeficiency virus (FIV) env and gag geness and Dirofilaria immitis plant to detect heartworm caused by D. immitis respectively

It is based on the 3' end of the PRRS ORF4. The PCR product was used in the construction of homology vector 90. 49.23, which incorporates a beta-galactosidase marker gene and PPRS ORF4 purpose of inserting foreign DNA, and was constructed for the purpose of inserting foreign DNA into recombinant RPV. Recombinant RPVs of the invention have foreign DNA inserted into non-essential regions of the RPV genome. They can be included in vaccines against animal pathogens, useful for immunising animals (especially avian species or mammals, including humans) against animal pathogens (claimed). e.g. felline pathogens (claimed) or human pathogens such as hepatitis B virus, human immunodeficiency virus, human influenza etc. (Updated on 06-AUG-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               PRRS; raccoonpox virus; vaccine; homology vector 902-49.23; PCR primer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New recombinant raccoompox virus containing foreign DNA inserted into non-essential region within the HindIII U genomic region, useful as a vaccine against pathogens in mammalian and avian species.
                                                                                                                   Gaps

                                                           Recombinant swine:pox virus contg. foreign DNA sequence - useful for delivery of vaccinating antigens or other therapeutic agents to humans or animals.
                                                                                                                                                                                                                                                                         The invention relates to a new recombinant swinepox virus (SPV) comprising, inserted into a HindIII M, N or K fragment of the SPV genome, a foreign DNA sequence that can be expressed in a SPV-infected host cell. Also new are homology vectors for production of recombinant SPV comprising double-stranded foreign sequence with, on both sides, double-stranded SPV DNA homologous to the viral genome on either side of the HindIII N fragment. The recombinant SPV are vectors for delivering vaccinating antigens to therapeutic agents to humans, other mammals or birds. The foreign dNA sequence may encode an antigen from an infectious agent or tumour, or a cytokine to stimulate an immune response. SPV can also be used as diagnostic reagents, e.g. to detect feline immunodeficiency virus of D. immitis (heartworm) infection. SPV is only
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   weakly pathogenic, species specific and induces an immune response. The present sequence is a PCR primer amplifying a foreign DNA sequence that can be expressed in a SPV-infected host cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ŝ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence represents a PCR primer used in an example from the present invention. The present invention specifically describes recombinant swinepox virus (SPV) comprising a foreign DNA (1) inserted into a SPV genome which is capable of being expressed in a host cell into which the virus is introduced, where (1) is inserted into: (a) an ECORI site within a region corresponding to a 3.2 kb subfragment of the HindIII K fragment which contains both a HindIII and an ECORI site, of the SPV genome, and optionally (b) an AccI site within a region corresponding to genome, and optionally (b) an AccI site within a region corresponding to cerombinant SPV can be used in a vaccine for immunishing an animal against recombinant SPV can be used in a vaccinated with the vaccine, particularly containing S-SPV-008, or is infected with a naturally cocurring wild-type pseudorabies virus. Also (1) inserted into cerombinant SPV can be used in a diagnostic assay, e.g. Feline immunodeficiency virus (FVV) env and gag genes and Dirofilaria immitis immunodeficiency virus (FVV) env and gag genes and Dirofilaria immitis processive of the complexity of the containing the containi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

The invention relates to a new recombinant swinepox virus (SPV)

comprising, inserted into a HindIII M, N or K fragment of the SPV genome,
a foreign DNA sequence that can be expressed in a SPV-infected host cell.
Also new are homology vectors for production of recombinant SPV

comprising double-stranded foreign sequence with, on both sides, double-stranded SPV DNA homologous to the viral genome on sither side of the HindIII N fragment. The recombinant SPV are vectors for delivering vaccinating antigens or therapeutic agents to humans, other mammals or birds. The foreign dNA sequence may encode an antigen from an infectious agent or tumour, or a cytokine to stimulate an immune response. SPV can also be used as diagnostic reagants, e.g. to detect feline immunodeficiency virus of D. immitis (heartworm) infection. SPV is only weakly pathogenic, species specific and induces an immune response. The present sequence is a PCR primer amplifying a foreign DNA sequence that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Recombinant swine:pox virus contg. foreign DNA sequence - useful for delivery of vaccinating antigens or other therapeutic agents to humans or

The present sequence represents a PCR primer used in an example from the present invention. The present invention specifically describes crecombinant swinepox virus (SVV) comprising a foreign DNA (I) inserted into a SPV genome which is capable of being expressed in a host cell into which the virus is introduced, where (I) is inserted into: (a) an ECORI site within a region corresponding to a 3.2 kb subfragment of the HindIII of Aragment which contains both a HindIII and an ECORI site, of the SPV genome, and optionally (b) an AcI site within a region corresponding to corresponding to State within a region corresponding to combinant SPV can be used in a vaccine for immunising an animal against SPV. The invention also provides a method for testing a swine to cetermine whether the swine has been vaccineted with the vaccine, particularly containing S-SPV-008, or is infected with a naturally cocurring wild-type pseudorabies virus. Also (I) inserted into recombinant SPV can be used in a diagnostic assay, e.g. Feline immunodeficiency virus (FIV) env and gag genes and Dirofilaria immitis may and 22kd are useful to detect feline immunodeficiency caused by FIV and to detect heartworm caused by D. immitis respectively
                    Recombinant swine pox virus - useful in vaccine for immunising animal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New isolated polynucleotide comprising an infectious cDNA encoding a North American Porcine Reproductive and Respiratory Syndrome Virus (PRRSV) RNA transcript, useful for preparing a vaccine against PRRSV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Porcine Reproductive and Respiratory Syndrome Virus, PCR primer #13.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    se; primer; RT-PCR; Virucide; Vaccine;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ð
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          요
                                                                                                                                                                                                                                                                                                                                      The present sequence represents a PCR primer used in an example from the present invention. The present invention specifically describes combinant swinepox virus (SPV) comprising a foreign DNA (I) inserted into a SPV genome which is capable of being expressed in a host cell into which the virus is introduced, where (I) is inserted into: (a) an BCORI site within a region corresponding to a 3.2 kb subfragment of the HindIII of Enome, and optionally (b) an AccI site within a region corresponding to cap. (b) the hindIII to BglII subfragment of the HindIII in fragment. The recombinant SPV can be used in a vaccine for immunising an animal against SPV. The invention also provides a method for testing a swine to cateruine whether the swine has been vaccinated with the vaccine, particularly containing S-SPV-008, or is infected with a naturally occurring wild-type pseudorabies virus. Also (I) inserted into the community of the invention and agagnest and pirofilaria immitts municipal are useful to detect feline immunodeficiency caused by FIV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                    Recombinant swine pox virus - useful in vaccine for immunising animal against swine pox virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

The invention relates to an isolated polynucleotide comprising an infectious CDNA encoding a North American Porcine Reproductive and Respiratory Syndkrome Virus (PRRSV) RNA transcript. Also included are the following: (1) a method of producing full-length infectious PRRSV CDNA; (2) a method of producing infectious practicles from an isolated till-length infectious PRRSV CDNA clone; and (3) a composition comprising the isolated polynucleotide or full-length infectious PRRSV CDNA. The polynucleotide further comprises at least one nucleotide deletion in at least one of the 3'end of ORF7 and 5'end of 3' untranslated region; and con more mutations, where the mutation is non-silent mutation in ORF5 or ORF7. It encodes a porcine viral polypeptide, which is a capsid protein of Porcine Circovirus Type II or its portion. The polynucleotide is useful for preparing a vaccine against PRRSV infection. The present sequence represents a primer used to construct full-length clones of cDNA encoding a North American Porcine Reproductive and Respiratory Syndrome Virus (PRRSV) RNA transcript.

New recombinant raccoompox virus containing foreign DNA inserted into a non-essential region within the HindIII U genomic region, useful as a vaccine against pathogens in mammalian and avian species.

Disclosure; Page 62; 164pp; English.

The present sequence is that of upstream primer 9/97.5 used in the PCR amplification of open reading frame 5 (ORF5) of swine reproductive and respiratory syndrome virus (PRRS). It is based on the 5° end of the PRRS ORP5, and introduces an EcoRI site at the 5° end of the gene. The PCR product was used in the construction of homology vector 938-94.25, which incorporates a beta-glucuronidase marker gene and the PRRS ORF5 gene flanked by raccompox virus (RPV) DNA, and was constructed for the purpose of inserting foreign DNA into recombinant RPV. Recombinant RPVs of the invention have foreign DNA inserted into non-essential regions of

The invention relates to a new recombinant swinepox virus (SPV)

comprising, inserted into a HindIII M, N or K fragment of the SPV genome,
a foreign DNA sequence that can be expressed in a SPV-infected host cell.
Also new are homology vectors for production of recombinant SPV
comprising double-stranded foreign sequence with, on both sides, double-stranded SPV DNA homologous to the viral genome on either side of the HindIII N fragment. The recombinant SPV are vectors for delivering vaccinating antigens or therapeutic agents to humans, other mammals or birds. The foreign dNA sequence may encode an antigen from an infectious also be used as diagnostic reagents, e.g. to detect feline immunodeficiency virus of D. immitis (heartworm) infection. SPV is only wealty pathogenic, species specific and induces an immune response. The present sequence is a PCR primer amplifying a foreign DNA sequence that Recombinant swine:pox virus contg. foreign DNA sequence - useful for delivery of vaccinating antigens or other therapeutic agents to humans or Example 37; Page 228; 502pp; English animala

```
The present sequence represents a PCR primer used in an example from the present invention. The present invention specifically describes recombinant swinepox virus (SPV) comprising a foreign DNA (I) inserted into a SPV genome which is capable of being expressed in a host cell into which the virus is introduced, where (I) is inserted into: (a) an BcoRI site within a region corresponding to a 3.2 kb subfragment of the HindIII at an EcoRI site, of the SPV genome, and optionally (b) an AccI site within a region corresponding to a 3.6 kb HindIII to BgIII subfragment of the HindIII M fragment. The recombinant SPV can be used in a vaccine for immunising an animal against SPV. The invention also provides a method for testing a swine to determine whether the swine has been vaccinated with the vaccine, particularly containing S-SPV-008, or is infected with a naturally occurring wild-type pseudorables virus. Also (I) inserted into recombinant SPV can be used in a diagnostic assay, e.g. Feline immunodeficiency virus (FTV) env and gag genes and Dirofilaria immitis immitis and 22kd are useful to detect feline immunodeficiency caused by FIV
                                                                       ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Recombinant swine pox virus - useful in vaccine for immunising animal against swine pox virus.

The present sequence represents a PCR primer used in an example from the present invention. The present invention specifically describes comprising a foreign DNA (1) inserted into a SPV genome which is capable of being expressed in a host cell into into a SPV genome which is capable of being expressed in a host cell into which the virus is introduced where (1) is inserted into: (a) an ECORI site within a region corresponding to a 3.2 kb subfragment of the HindIII of Argment which contains both a HindIII and an ECORI site, of the SPV genome, and optionally (b) an AccI site within a region corresponding to a 3.6 kb HindIII to BgIII subfragment of the HindIII M fragment. The recombinant SPV can be used in a vaccine for immunishing an animal against SPV. The invention also provides a method for testing a swine to particularly containing S-SPV-008, or is infected with a naturally occurring wild-type pseudorabies virus. Also (I) inserted into corresponding immunodeficiency virus (IVI) env and gag genes and Dirofilaria immitis immities paid are useful to detect feline immunodeficiency caused by FIV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                     Recombinant swine pox virus - useful in vaccine for immunising animal against swine pox virus.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                   The present sequence is that of dowstream primer 1/96.14 used in the PCR amplification of open reading frame 5 (ORF5) of swine reproductive and respiratory syndrome virus (PRRS). It is based on the 3' end of ORF5. The PCR product was used in the construction of homology vector 902-49.34, which incorporates a beta-galactosidase marker gene and the PPRS ORF5 gene flanked by raccoompox virus (RPV) DMA, and was constructed for the purpose of inserting foreign DNA into recombinant RPV. Recombinant RPVs of the invention have foreign DNA inserted into non-essential regions of the RPV genome. They can be included in vaccines against animal pathogens, useful for immunising animals (especially avian species or mammals, including humans) against animal pathogens (claimed), e.g. felline pathogens (claimed) or human pathogens such as hepatitis B virus, human immunodeficiency virus, human influenza etc. (Updated on 06-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Multivalent vaccine; pig; pathogen; respiratory disease; SIV; PRRSV; HCV; digestive disease; Aujeszky's disease virus; pseudorabies virus; vaccine; auid herpesvirus 1; swine influenza virus; hog cholera virus; vector; porcine respiratory and reproductive syndrome virus; haemagglutinin; SIRSV; swine infertility and respiratory syndrome virus;
                                                                                                                                                                                                                                                                                                             New recombinant raccoonpox virus containing foreign DNA inserted into a non-essential region within the HindIII U genomic region, useful as a vaccine against pathogens in mammalian and avian species.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a multivalent vaccine for protecting pigs against several pathogens, especially pathogens associated with respiratory and digestive diseases. The pathogens are especially selected from Aujeszky's disease virus, swine influenza virus (SIV), porcine respiratory and reproductive syndrome virus (PRRSV), hog cholera virus (CHCV) and Actinobacillus pleuropneumoniae. The vaccines are preferably composed of polynucleotide sequences encoding 3 antigens, all as part of vectors. Primers AAV49308-V49309 were used to PCR amplify the PRRSV strain ATC-VR232 ORPS gene encoding the gp45 envelope glycoprotein. The sequence was subcloned into the plasmid pVRI012 to generate plasmid pAB992 for use in the vaccine. (Updated on 27-AUG-2003 to correct OS

```
present invention. The present invention specifically describes

crecombinant swinepox virus (SPV) comprising a foreign DNA (I) inserted

into a SPV genome which is capable of being expressed in a host cell into

which the virus is introduced, where (I) is inserted into: (a) an EcoRI

site within a region corresponding to a 3.2 kb subfragment of the HindIII

K fragment which contains both a HindIII and an EcoRI site, of the SPV

cgenome, and optionally (B) an AcI site within a region corresponding to

c genome, and optionally (B) an AcI site within a region corresponding to

c genome, and optionally (B) are used in a vaccine for immunising an animal against

c sPV. The invention also provides a method for testing a swine to

determine whether the swine has been vaccinated with the vaccine,

particularly containing S-SPV 008, or is infected with a naturally

c occurring wild-type pseudorables virus. Also (I) inserted into

recombinant SPV can be used in a diagnostic assay, e.g. Feline

c immunodeficiency virus (FIV) env and gag genes and Dirofilaria immitis

c man 22kd are useful to detect feline immunodeficiency caused by FIV

and to detect heartworm caused by D. immitis respectively
                          The present sequence represents a PCR primer used in an example from the

                                                                                                                                                                                                                                                                                                                           The invention relates to a new recombinant swinepox virus (SPV) comprising, inserted into a HindIII M, N or K fragment of the SPV genome, a foreign DNA sequence that can be expressed in a SPV-infected host cell. Also new are homology vectors for production of recombinant SPV comprising double-stranded foreign sequence with, on both sides, double-stranded SPV DNA homologous to the viral genome on either side of the HindIII N fragment. The recombinant SPV are vectors for delivering vaccinating antigens or therapeutic agents to humans, other mammals or birds. The foreign dNA sequence may encode an antigen from an infectious agent or tumour, or a cytokine to stimulate an immune response. SPV can also be used as diagnostic reagents, e.g. to detect feline immunodeficiency virus of D. immitis (heartworm) infection. SPV is only weakly pathogenic, species specific and induces an immune response. The present sequence is a PCR primer amplifying a foreign DNA sequence that
                                                                                                                                                                  Recombinant swine:pox virus contg. foreign DNA sequence - useful for delivery of vaccinating antigens or other therapeutic agents to humans or

ö The present sequence represents a PCR primer used in an example from the present invention. The present invention specifically describes recombinant swinepox virus (SPV) comprising a foreign DNA (I) inserted into a SPV genome which is capable of being expressed in a host cell into which the virus is interacted into: (a) an ECORI site within a region corresponding to a 3.2 kb subfragment of the HindIII K fragment which contains both a HindIII and an ECORI site, of the SPV Recombinant swine pox virus - useful in vaccine for immunising animal against swine pox virus. The present sequence is that of upstream primer 1/96.13 used in the PCR amplification of open reading frame 5 (ORF5) of swine reproductive and respiratory syndrome virus (PRRS). It is based on the 5' end of the PRRS ORF5, and introduces an ECORI site at the 5' end of the gene. The PCR incorporates a beta-galactosidase marker gene and the PPRS ORF5 gene finanked by raccoompox virus (RPV) DNA, and was constructed for the propose of inserting foreign DNA into recombinant RPV. Recombinant RPVs of inserting foreign DNA into recombinant RPV. Recombinant RPVs of the invention have foreign DNA into recombinant and regions of the RPV genome. They can be included in vaccines against animal pathogens, useful for immunising animals (especially avian species or mammals, including humans) against animal pathogens (Claimed), egg. celline pathogens (Claimed) or human immunodeficiency virus, human influenza etc. (Updated on 06-AUG-human immunodeficiency virus, human influenza etc. (Updated on 06-AUG-
                                                                                                                                                                                                                                                                                                                                                    ö
genome, and optionally (b) an AccI site within a region corresponding to a 3.6 kb HindIII to BglII subfragment of the HindIII M fragment. The recombinant SPV can be used in a vaccine for immunising an animal against SPV. The invention aloo provides a method for testing a swine to particularly containing $.SPV-008, or is infected with a naturally occurring wild-type pseudorables virus. Also (I) inserted into recombinant SPV can be used in a diagnostic assay, e.g. Feline immunodeficiency virus (FIV) env and gag genes and Dirofilaria immitis p39 and 22kd are useful to detect feline immunodeficiency caused by FIV and to detect heartworm caused by D. immitis respectively
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New recombinant raccoonpox virus containing foreign DNA inserted into a non-essential region within the HindIII U genomic region, useful as a vaccine against pathogens in mammalian and avian species.

amplification of open reading frame 3 (ORF3) of swine reproductive and respiratory syndrome virus (PRRS). It is based on the 3' end of the PRRS ORF3, and introduces an Econstruction of homology vector 334-64.2, which incorporates a beta-glucuronidase marker gene and the PPRS ORF3 gene flanked by raccompox virus (RPV) DNA, and was constructed for the purpose of inserting foreign DNA into recombinant RPV. Recombinant RPVs of the invention have foreign DNA inserted into non-essential regions of the invention have foreign DNA inserted into non-essential regions of pathogens, useful for immunising animals (especially avian species or mammals, including humans) against animal pathogens (claimed), e.g. felline pathogens (claimed) or human pathogens (claimed), e.g. thuman immunodeficiency vitus, human influenza etc. (Updated on 06-AUG-2003 to correct OS field.)
                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence is that of downstream primer 9/97.10 used in the PCR

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Recombinant swine:pox virus contg. foreign DNA sequence - useful for delivery of vaccinating antigens or other therapeutic agents to humans or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      comprising, inserted into a Hindill M. Nor K fragment of the SPV genome, a foreign DNA sequence that can be expressed in a SPV-infected host cell. Also new are homology vectors for production of recombinant SPV comprising double-stranded foreign sequence with, on both sides, double-stranded foreign sequence with, on both sides, double-stranded SPV DNA homologous to the viral genome on either side of the Hindill N fragment. The recombinant SPV are vectors for delivering vaccinating antigens to therspeutic agents to humans, other mammals or birds. The foreign dNA sequence may encode an antigen from an infectious agent or tumour, or a cytokine to stimulate an immune response. SPV can also be used as diagnostic reagents, e.g. to detect feline immunodeficiency virus of D immitis (heartworm) infection. SPV is only weakly pathogenic; specific and induces an immune response. The present sequence is a PCR primer amplifying a foreign DNA sequence that can be expressed in a SPV-infected host cell.

The present sequence represents a PCR primer used in an example from the present invention. The present invention specifically describes recombinant swinepox virus (SPV) comprising a foreign DNA (I) inserted into a SPV genome which is capable of being expressed in a host cell into which the virus is introduced, where (I) is inserted into: (a) an ECORI site within a region corresponding to a 3.2 kb subfragment of the HindIII K fragment which contains both a HindIII and an ECORI site, of the SPV genome, and optionally (b) an AccI site within a region corresponding to cerombinant SPV can be used in a vaccine for immunishing an animal against SPV. The invention also provides a method for testing a swine to particularly containing S-SPV-008, or is infected with a naturally cocurring wild-type pseudorabies virus. Also (I) inserted into cerombinant SPV can be used in a diagnostic assay, e.g. Peline immittis immunication virus (FIV) env and gas genes and Dirofilaria immittis page and 22kd are useful to detect feline immunodeficiency caused by FIV
Recombinant swine pox virus - useful in vaccine for immunising animal against swine pox virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Swinepox virus, SPV, recombinant, vaccine, immunisation, diagnosis, pseudorabies virus, feline immunodeficiency virus, FIV, heartworm;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ð
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            셤
                                                                                                                                                                                                                                                                                                                                                                         The present sequence represents a PCR primer used in an example from the present invention. The present invention specifically describes recombinant swinepox virus (SPV) comprising a foreign DNA (1) inserted into a SPV genome which is capable of being expressed in a host cell into which the virus is introduced, where (1) is inserted into: (a) an EcoRI site within a region corresponding to a 3.2 kb subfragment of the HindIII K fragment which contains both a HindIII and an EcoRI site, of the SPV genome, and optionally (b) an AcI site within a region corresponding to 3.5 kb HindIII to BglII subfragment of the HindIII M fragment. The recombinant SPV can be used in a vaccine for immunising an animal against SPV. The invention also provides a method for testing a swine to particularly containing S-SPV-008, or is infected with a naturally cocurring wild-type pseudorabies virus. Also (1) inserted into cocurring wild-type pseudorabies virus. Also (1) inserted into immunodeficiency virus (FIV) env and gag genes and Dirofilaria immitis immunice the complex of the second into the second in a diagnostic assay, e.g. Feline immitis immitis immitis the second s

The invention may allow development of compounds with antiviral or immunoprotective activity or a vaccine. The ISU-55 polypeptides can be used to induce antibodies against PRRSV effective to induce the antibodies in a pig. Compositions comprising the ISU-55 polypeptides can be used as vaccines to protect pigs from a porcine reproductive and respiratory disease. The ISU-55 polypeptides can antibodies in pigs.
                                                                                                                                                                                                                                                  Porcine Reproductive and Respiratory Syndrome Virus (PRRSV) DNA sequences and protein products.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New recombinant raccoonpox virus containing foreign DNA inserted into a non-essential region within the HindIII U genomic region, useful as a vaccine against pathogens in mammalian and avian species.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    PRRS; raccoonpox virus; vaccine; homology vector 902-49.14; PCR primer;

amplification of open reading frame 3 (ORF3) of swine reproductive and respiratory syndrome virus (PRRS). It is based on the 3' end of the PRRS ORF3. The PCR product was used in the construction of homology vector 902-49.14, which incorporates a beta-galactosidase marker gene and PPRS ORF3 flanked by raccoompox virus (RPV) DNA, and was constructed for the purpose of inserting foreign DNA into recombinant RPV secombinant RPVs of the invention have foreign DNA into recombinant RPV secombinant RPV senome. They can be included in vaccines against animal pathogens, useful for immunising animals (especially avian species or mammals, including humans) againet animal pathogens (claimed), e.g. feline pathogens (claimed) or human pathogens such as hepatitis B virus, human immunodeficiency virus, human influenza etc. (Updated on 06-AUG-2003 to correct OS field.)
   present sequence is that of downstream primer 1/96.8 used in the PCR

New isolated polynucleotide comprising an infectious cDNA encoding a North American Porcine Reproductive and Respiratory Syndrome Virus (PRRSV) RNA transcript, useful for preparing a vaccine against PRRSV infection.

Disclosure; SEQ ID NO 23; 34pp; English.

The invention relates to an isolated polynucleotide comprising an infectious cDNA encoding a North American Porcine Reproductive and Respiratory Syndrome Virus (PRRSY) RNA transcript. Also included are the following: (1) a method of producing full-length infectious PRRSY cDNA; (2) a method of producing infectious virus particles from an isolated full-length infectious PRRSV cDNA clone; and (3) a composition comprising the isolated polynucleotide or full-length infectious PRRSY cDNA. The polynucleotide further comprises: at least one nucleotide deletion in at least one of the 3'end of ORF7 and 5'end of 3' untranslated region; and one or more mutations, where the mutation is non-silent mutation in ORF5 ADJ61032

or ORP7. It encodes a porcine viral polypeptide, which is a capsid protein of Porcine Circovirus Type II or its portion. The polynuclectide is useful for preparing a vaccine against PRRSV infection. The present sequence represents a primer used to construct full-length clones of CDNA encoding a North American Porcine Reproductive and Respiratory Syndrome Virus (PRRSV) RNA transcript. 8888888888

as a New polynucleotide encoding an infectious RNA molecule of a North American porcine reproductive and respiratory syndrome virus for use vaccine in protecting swine and other animals from infection by a pathogen. 

Example 6; Page 23; 53pp; English.

The present sequence is that of a primer used for synthesizing the downstream flanking region to an insertion site between ORF1b and ORF2 of the North American porcine reproductive and respiratory syndrome (PRRS) virus P129A (see AAAZ7809). The primer binds to nucleotides 13819-13844 in ORF5. A replication-competent PRRS virus was constructed for use as a vector for expression of foreign genes. The invention relates to polynucleotide molecules, plasmids, viral vectors and transfected host polynucleotide molecules, viral vectors and transfected host polynucleotide molecules, viral vectors and transfected host encoding a genetically modified North American PRRS virus that encodes lor more heterologous antigenic epicopes, for use as a vaccine. (Updated or more heterologous antigenic epito on 06-AUG-2003 to correct OS field.)

2 Primers (AAT14398 and AAT14399) were used to amplify ORP-5 (see also AAT14390) of porcine reproductive and respiratory syndrome virus (PRRSV) Iowa strain isolate ISU-12 (VR 2385). ORP-6 (AAT14391) was amplified using 2 other primers (AAT1400-01) and ORP-7 (AAT14392) using 2 further primers (AAT14402-03). Amplified fragments were cloned into baculovirus transfer vector pyll393 and used for produ. of recombinant Iowa strain infectious agent proteins (ORF-7 products, see also AAR94701-03) in Hi-Pive insect cells. These proteins can be used in subunit vaccines against

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New porcine respiratory and reproductive disease virus - used to prepare vaccines and antibodies for diagnosis, treatment and prophylaxis of virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The sequences given in AAQ63585-90 are primers which were used in the amplification of ORF-5, ORF-6 and ORF-7 of the infectious agent associated with the Iowa strain of porcine respiratory and reproductive syndrome, termed ISU-12. The isolated ISU-12 sequence may be used to infect cells and from these, the vaccine of the invention can be produced. This vaccine may be used for protecting pigs against a porcine respiratory and reproductive disease (PRRD). Antibodies to the vaccine may also be used in treating PRRD and for assaying for the virus. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                        Primer; polymerase chain reaction; PCR; amplify; probe; Iowa strain; infectious agent; porcine respiratory and reproductive syndrome; ISU-12; vaccine; porcine respiratory and reproductive disease; PRRD; antibody;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                     PCR primers AAV99412-20 were used to amplify open reading frame 4 (ORF4) of Porcine reproductive and respiratory syndrome virus (PRRSV), in the course of the invention. ORF4 encodes GP4 protein, from which antigenic peptides can be derived. The peptides are able to elicit neutralising antibodies. Such antigenic peptides are used in vaccines to protect pigs against PRRSV infection, thus reducing the occurrence of PRRSV in pig herds and aiding in its eradication. The peptides may also be used diagnostically for detection of PRRSV specific antibodies, i.e. to diagnose infection, to differentiate between vaccinated and naturally infected animals and to disfinguish between different PRRSV isolates. Synthetic antibodies are used to detect antigens containing the epitopes
                                                                                                                                                                                                                                                                                                      New peptides containing epitopes of porcine reproductive and respiratory syndrome virus - useful in vaccines and for diagnostic tests, particularly for differentiating between infected and vaccinated animals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Primer; polymerase chain reaction; PCR; amplify; probe; Iowa strain; infectious agent; porcine respiratory and reproductive syndrome; ISU-12; vaccine; porcine respiratory and reproductive disease; PRRD; antibody;

                                                                                                                   The sequences given in AAQ63573-79 are primers which were used in the amplification of probes for the isolation of the 3' terminal region of the infectious agent associated with the Infectian of porcine respiratory and reproductive syndrome, termed ISU-12. The isolated ISU-12 sequence may be used to infect cells and from these, the vaccine of the invention can be produced. This vaccine may be used for protecting pigs against a porcine respiratory and reproductive disease (PRRD). Antibodies to the vaccine may also be used in treating PRRD and for assaying for the virus. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New porcine respiratory and reproductive disease virus - used to prepare vaccines and antibodies for diagnosis, treatment and prophylaxis of virus

respiratory and reproductive syndrome, termed ISU-12. The isolated ISU-12 sequence may be used to infect cells and from these, the vaccine of the invention can be produced. This vaccine may be used for protecting pigs against a porcine respiratory and reproductive disease (PRRD). Antibodies to the vaccine may also be used in treating PRRD and for assaying for the virus. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New porcine reproductive and respiratory syndrome virus DNA - and proteins encoded by open reading frames of an Iowa strain of the virus; are used in vaccines against PRRSV in pigs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Primers PP284 (AAT14377) and PP285 (AAT14378) were used for the PCR amplification of the extreme 3' end of a porcine reproductive and respiratory syndrome virus (PRRSV) Iowa strain isolate ISU-12 (WR 2385) CDNA clone. The PCR product was used as a probe in Northern blot analysis, resulting in the identification of a 2062-bp 3' terminal sequence (AAT14389) of WR 2385 including ORFs 5, 6 and 7 (AAT14390-92) coding for proteins (AAR94701-03) useful in vaccine development

Porcine reproductive and respiratory syndrome virus; PRRSV; coronavirus; reproductive failure; pneumonia; pig; preweaning mortality; torovirus;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New porcine reproductive and respiratory syndrome virus DNA - and proteins encoded by open reading frames of an Iowa strain of the virus; are used in vaccines against PRRSV in pigs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Primers PP284 (AAT14377) and PP285 (AAT14378) were used for the PCR amplification of the extreme 3' end of a porcine reproductive and respiratory syndrome virus (PRRSV) Iowa strain isolate ISU-12 (VR 2385) cDNA clone. The PCR product was used as a probe in Northern blot analysis, resulting in the identification of a 2060-bp 3' terminal sequence (AAT14189) of VR 2385 including ORFs 5, 6 and 7 (AAT14190-92) coding for proteins (AAR94701-03) useful in vaccine development
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gape

AAT79997-T80016 represent amplification primers for ORFs 1b-7 of porcine reproductive and respiratory syndrome virus (PRRSV). The amplified sequences can be used in the polymucleotides of the invention. PRRSV is a new and severe disease in swine, characterised by reproductive failure in sows and guilts, pneumonia in young growing pigs, and an increase in preweaming mortality. However, there are marked diferences in pathogenicity between iolates (with ISU327) being the least virulent solate known). The genomic organisation of PRRSV resembles coronaviruses and toroviruses, in that their replication involves the formation of a 3' coterminal nested set of subgenomic mRNAs. ORFs 5, 6, and 7 encode a cytosylated membrane protein, an unglycosylated membrane protein, an unglycosylated membrane protein, an unglycosylated membrane protein, an unglycosylated membrane associated proteins. The polymucleotides of the invention, encode a protein that is at least 88*, but less than 100* homologous to one of proteins encoded by one of the ORFs of these can be used in a vaccine to protect a pig against PRRSV. Antibodies raised against the polympetides can be used to treat a pig suffering from PRRSV, and to assay for a PRRSV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

AAT79997-T80016 represent amplification primers for ORFs 1b-7 of porcine reproductive and respiratory syndrome virus (PRRSV). The amplified sequences can be used in the polynucleotides of the invention. PRRSV is a new and severe disease in swine, characterised by reproductive failure in sows and guilts, pneumonia in young growing pigs, and an increase in preventing mortality. However, there are marked diferences in pathogenicity between iolates (with ISU3927 being the least virulent isolate known). The genomic organisation of PRRSV resembles coronaviruses and toroviruses, in that their replication involves the formation of a 3' cocterminal nested set of subgenomic mRNAs. ORFS 5, 6, and 7 encode a glycosylated membrane protein, an unglycosylated membrane protein, respectively. ORFS 2 to 4 encode protein, and a nucleocapsid protein, respectively. ORFS 2 to 4 encode proteins with the characteristics of membrane associated proteins. The polynucleotides of the invention, encode a protein that is at least 88%, but less than 100% homologous to one of proteins encoded by one of the ORFS of these sequences. The polynucleotides of the invention, and their encoded polyneptides can be used in a vaccine to protect a pig against PRRSV.

Antibodies raised against the polypeptides can be used to treat a pig enfering for a person
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      porcine reproductive and respiratory syndrome virus; PRRSV; antiviral; immunoprotective; vaccine; ISU-55; porcine reproductive and respiratory disease; PCR; primer; 88.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                    Porcine reproductive and respiratory syndrome virus DNA sequences - useful for diagnosis, treatment and prevention of infection in pigs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Porcine reproductive and respiratory syndrome virus PCR primer 38.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Porcine Reproductive and Respiratory Syndrome Virus (PRRSV) DNA sequences
                                                                                                                                                                                                                                                                                     This invention relates to novel DNA and polypeptide sequences (ISU-55) of a porcine reproductive and respiratory syndrome virus (PRRSV). The invention may allow development of compounds with antiviral or immunoprotective activity or a vaccine. The ISU-55 polypeptides can be used to induce antibodies against PRRSV effective to induce the antibodies in a pig. Compositions comprising the ISU-55 polypeptides can be used as vaccines to protect pigs from a porcine reproductive and respiratory disease. The ISU-55 polypeptides can be used to induce antibodies in pigs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                porcine reproductive and respiratory syndrome virus; PRRSV; antiviral; immunoprotective; vaccine; ISU-55; porcine reproductive and respiratory disease; PCR; primer; 88.

American porcine reproductive and respiratory syndrome virus for use as a
vaccine in protecting swine and other animals from infection by a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence is that of a PCR primer corresponding to nucleotides 15218-15339 at the 3' end of the North American porcine reproductive and respiratory syndrome (PRRS) virus P1294 genome (ERRS) used as genome (PRRS) of the P1294 genome (PRRS) of the P1294 genome, involving ligating the 3' and 5' ends of the P1294 genome, involving ligating the 3' and 5' ends of viral RNA and using RT-PCR to amplify the junction fragment. The invention relates to polynucleotide molecules, plasmids, viral vectors and transfected host cells that comprise this DNA sequence. It also relates to polynucleotide molecules, viral vectors and transfected host genetically modified North American PRRS virus that is disabled in its ability to cause PRRS, or which encodes 1 or more heterologous antigenic
                                                                                                 This invention relates to novel DNA and polypeptide sequences (ISU-55) of
                                                                                                                     a porcine reproductive and respiratory syndrome virus (PRRSV). The invention may allow development of compounds with antiviral or immunoprotective activity or a vaccine. The ISU-55 polypeptides can be used to induce antibodies against PRRSV effective to induce the antibodies in a pig. Compositions comprising the ISU-55 polypeptides can be used as vaccines to protect pigs from a porcine reproductive and respiratory disease. The ISU-55 polypeptides can be used in pigs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         North American PRRS virus; Nidovirales virus; pig; swine; vaccine;

versions of viruses, using multiple passage through cell cultures and involving the removal of samples of the virus prior to the induction of cytopathic effects. The sample is then inoculated into the next cell culture. The sequence of the naturally-occurring Lelystad virus (also known as the porcine reproductive and respiratory syndrome virus or PRRSV) atypical strain JA-142 is provided, along with that of a modified version of the virus. The modified version can be used in the vaccination
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Passaging viruses to attenuation comprises maintaining virus in logarithmic phase of replication throughout multiple cell culture passages, useful for protection against atypical porcine reproductive and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     primers AAV60655-V60656 were used to RT-PCR amplify the coding sequence for the nucleocapsid protein from the Porcine Reproductive and sespiratory Syndrome Virus (PRRSV) American isolate Canada 14/96 (AAW68457). The coding sequence was isolated from viral RNA obtained from the serum of a pig infected with the Canada 14/96 isolate. The open reading frame obtained by sequencing the fragment encodes a 123 amino acid sequence. The insert sequence was subsequently cloned into the bacterial expression vector periox, to produce a fusion protein (AAW68459) comprising the PRRSV nucleocapsid protein and the bacteriophage T7 gene protein, and especially the fusion protein, is useful as a reagent in immunoassays to diagnose PRRSV
                                                                                                                                                                                                                                                                                                                                                      Nucleocapsid, Porcine Reproductive and Respiratory Syndrome Virus, PRRSV, pig; serum; RT-PCR, reverse transcription; amplification; fusion protein; primer, bacteriophage T7; gene 10; E. coli; immunoassay; diagnosis; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New fusion proteins comprising Porcine Reproductive and Respiratory Syndrome Virus nucleocapsid - useful as reagents in immuno:diagnosis of PRRS, are produced recombinantly in bacterial hosts.

The invention describes a multi-passage method for attenuating a virus comprising successively replicating the virus through inoculation and replication of the virus in respective individual cell cultures until attenuation is achieved. The improvement comprises removing virus-containing samples from the certain cell cultures while the virus is replicating at a logarithmic rate and prior to induction of cytopathic effects in the certain cell cultures and inoculating the next respective cell culture passages with the samples. Also described are: a porcine reproductive and respiratory syndrome (PRRS) virus having ATCC Accession Number VR-2618; a vaccine comprising the virus; a method of immuning swine against PRRS; an isolated DNA sequence having 15424 bp; a method of identity with a fully defined sequence having IS424 bp; a method of identity with a fully defined sequence having RNA that is cleaved into known fragment numbers or lengths after cleavage by a restriction enzyme; a method of reducing reproductive failure in swine; and a method of differentiating between strains of PRRSV. The multi-passage method for differentiating between strains of PRRSV. The multi-passage method for attenuating a virus is useful for preparing a vaccine against atypical PRRS virus strains. This sequence represents a primer used to isolate DNA encoding an attentuated PRRS virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                       Multi-passage method for attenuating a virus by removing virus-containing samples from the certain cell cultures and inoculating the next respective cell culture passages with the samples.

The invention relates to a virus attenuated by a multiple-passage attenuation method, and which is capable of eliciting antibody response specific for porcine reproductive and respiratory syndrome virus (PRRSV) strains in swine. Also described are the following: (i) a vaccine comprising the virus; (ii) a method of differentiating between attenuated comprising the virus; (ii) a method of differentiating between attenuated comprising the virus; (ii) a method of differentiating between attenuated comprising virus after digestion enzyme. Also depending upon wherher the strain is attenuated or virulent; (iii) an attenuated PRRSV strain having N+1 fragments after digestion by the restriction enzyme, where strains having N fragments after digestion by the restriction enzyme are not attenuated; (iv) a method of reducing reproductive and/or respiratory failure in swine by providing the restriction and/or respiratory failure in swine by providing the reproductive and/or respiratory failure in swine by providing the attenuated by a multiple-passage attenuation method comprising successively replicating the virus through inoculation and replication cell cultures while the virus is achieved, and inoculating the next respective cell culture passages with the sample. The successive respication includes removing virus-containing samples from at least certain of the cell cultures while the virus is substantially are replicating the next respective cell culture and having been passaged a minimum of 200 times in cell culture. In reducing respiratory approximatory addictive and/or respiratory failure in swine, the strain is selected from RespRRS/Repro, and/or Ad-141. The virus is the reproductive and respiratory approximatory approximatory and/or virus strains in swine. The proportion of reproductive and respiratory approximatory approximatory and/or virus strains in swine. The proportion of reproductive and respiratory approximatory approximatory approximatory approximatory approximatory approximatory approximatory approximatory 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New virus attenuated by a multiple-passage attenuation method, useful for eliciting antibody response specific for porcine reproductive and respiratory syndrome virus strains in swine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                sequence represents a PCR primer used to isolate the PRRSV genomic DNA sequence.

RESULT 46

```
The present invention relates to a method of determining the susceptibility or resistance of an animal to porcine reproductive and susceptibility or resistance of an animal to porcine reproductive and constructive syndrome virus (FRRSV). This involves assaying for CD 151 in a sample of cellular material of known origin from the animal. In a campounds designated anti-RNA entry proteins (anti-RNBS). The method is useful for determining susceptibility and resistance to PRRSV in an animal. This is particularly useful for improving swine breeding or for animal. This is particularly useful for improving swine breeding or for developing on-simian recombinant cell lines for propagating the virus, for producing anti-viral compounds or vaccines for inducing immunity against PRRSV, and for diagnosing PRRSV infection in a swine. The present sequence data for this parent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                               CD 151; porcine reproductive and respiratory syndrome virus; PRRSV; pig; selective breeding; xenotransplant; anti-RNA entry protein; anti-REP; anti-viral; vaccine; PCR; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              syndrome virus (PRRSV), useful for improving swine breeding, for CD 151 in a sample of cellular material of known origin

Kapil S,

Determination of susceptibility to porcine reproductive and respiratory syndrome virus non-invasively useful e.g. to breed pigs with low susceptibility or classify infection resistance in an animal, by assaying or CD

Example 1; SEQ ID NO 31; 45pp; English.

The invention describes a method to identify susceptibility to porcine reproductive and respiratory syndrome virus (PRRSV) in an animal by assaying a cellular material sample from known origin in the animal for CD 151. The method is useful to determine the susceptibility of animals (especially pigs) to PRRSV and to compare susceptibility to a known susceptibility pigs) to PRRSV and to compare susceptibility to a known to rigin. It can be used to determine if an animal is resistant to PRRSV infection, by determining presence/absence of CD 151, and to classify resistance levels. It is especially useful to select animals for breeding, by selecting animals with CD 151 levels lower (especially a class to a lower) than a known standard (especially for material of the same cellular origin). Polymucleotides encoding CD 151 are useful to produce vaccines and to modify PRRSV production in cells susceptible to PRRSV infection, especially to increase PRRSV production e.g. in vaccine virus stock. They are especially useful to produce non-simian vaccines, compare pressure from pigs to humans. They may be used to modulate virus they may be used to modulate virus playmucleotides may be used to modulate viral RNA (especially PRRSV RNA) entry into compare PRRSV susceptibility factors between individual swine. They may be included in plasmids useful to render a cell line susceptible to PRRSV infection, useful to produce non-simian lines for dimensioned to included in vectors and used to integrate CD 151 into a chromosome. They can also be used to produce non-simian lines for included in vectors and used to integrate CD 151 into a chromosome. They can also be used to produce or integrate CD 151 into a chromosome imminity for the produce or integrate CD 151 into a chromosome. They can also be used to produce non-simian produce vaccines for individual swine produce produces produce produces produce produces produces produce produces produce produces produce produces produce produces produce produces produces produces produces produc This sequence represents a primer used to isolate immunity against PRRSV. This DNA encoding porcine CD 151.

                                                                                                                                                                                                                                                                                                                                                                                                                    The sequences given in AAQ63573-79 are primers which were used in the amplification of probes for the isolation of the 3' terminal region of the infectious agent associated with the IOwa errain of porcine respiratory and reproductive syndrome, termed ISU-12. The isolated ISU-12 sequence may be used to infect cells and from these, the vaccine of the invention can be produced. This vaccine may be used for protecting pigs against a porcine respiratory and reproductive disease (PRRD). Antibodies to the vaccine may also be used in treating PRRD and for assaying for the virus. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                       New porcine respiratory and reproductive disease virus - used to prepare vaccines and antibodies for diagnosis, treatment and prophylaxis of virus

The isolated ISU-12 sequence may be used to infect cells and from these, the vaccine of the invention can be produced. This vaccine may be used for protecting pigs against a porcine respiratory and reproductive disease (PRRD). Antibodies to the vaccine may also be used in treating PRRD and for assaying for the virus. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                               New porcine respiratory and reproductive disease virus - used to prepare vaccines and antibodies for diagnosis, treatment and prophylaxis of virus

                                                                                                                                                                                                   ઠ
                                                                                                                                                                                                                   g
                                                                                                                                                     The sequences given in AAQG3573-79 are primers which were used in the amplification of probes for the isolation of the 3' terminal region of the infectious agent associated with the lows etrain of porcine respiratory and reproductive syndrome, termed ISU-12. The isolated ISU-12 sequence may be used to infect cells and from these, the vaccine of the invention can be produced. This vaccine may be used for protecting pigs against a porcine respiratory and reproductive disease (PRRD). Antibodies to the vaccine may also be used in treating PRRD and for assaying for the virus. (Updated on 25-MAR-2003 to correct PN field.)

The isolated ISU-12 sequence may be used to infect cells and from these, the vaccine of the invention can be produced. This vaccine may be used for protecting pigs against a porcine respiratory and reproductive disease (PRRD). Antibodies to the vaccine may also be used in treating PRRD and for assaying for the virus. (Updated on 25-MAR-2003 to correct PN field.)

Primers PP286 (AAT14379) and PP287 (AAT14380) were used to generate a probe from the 5' end of lambda-75, a cDNA clone including the 3' end of porcine reproductive and respiratory syndrome virus (PRRSV) lowa strain isolate ISU-12 (VR 2385). Further positive plaques were identified using the probe. The primers were also used as sequencing primers to obtain internal sequences. A 2062-bp 3' terminal sequence (AAT14389) of VR 2385 was obtd. that included ORFs 5, 6 and 7 (AAT14390-92) coding for proteins (AAR94701-03) useful in vaccine development
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New porcine reproductive and respiratory syndrome virus DNA - and proteins encoded by open reading frames of an Iowa strain of the virus; are used in vaccines against PRRSV in pigs.
                                                                                                           Porcine reproductive and respiratory syndrome virus; PRRSV; vaccine; antigen; polymerase chain reaction; PCR; primer; 88.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Porcine reproductive and respiratory syndrome virus; PRRSV; vaccine; antigen; polymerase chain reaction; PCR; primer; ss.

Primers PP288 (AAT14381), PP289 (AAT14382) and PP386 (AAT14383) were used as sequencing primers to obtain internal sequences of cDNA clones corresponding to the 3' end of porcine reproductive and respiratory syndrome virus (PRRSV) Iowa strain isolate [S15-12 (WR 2385). A 2062-bp 3' terminal sequence (AAT14389) of WR 2385 was obtd. that included ORFs 5, 6 and 7 (AAT14390-92) coding for proteins (AAR94701-03) useful in vaccine
                                                                                                                               Primers PP288 (AAT14381), PP289 (AAT14382) and PP386 (AAT14383) were used as sequencing primers to obtain internal sequences of CDNA clones corresponding to the 3' end of porcine reproductive and respiratory syndrome virus (PRSA) Iowa strain isolate 1871-12 (WR 2385). A 2062-bp 3' terminal sequence (AAT14389) of VR 2385 was obtd. that included ORFS 5, 6 and 7 (AAT14390-92) coding for proteins (AAR94701-03) useful in vaccine
                             New porcine reproductive and respiratory syndrome virus DNA - and proteins encoded by open reading frames of an Iowa strain of the virus; are used in vaccines against PRRSV in pigs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New porcine reproductive and respiratory syndrome virus DNA - and proteins encoded by open reading frames of an Iowa strain of the virus; are used in vaccines against PRRSV in pigs.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                               Primers PP286 (AAT14379) and PP287 (AAT14380) were used to generate a probe from the 5' end of lambda-75, a cDNA clone including the 3' end of porcine reproductive and respiratory syndrome virus (PRRSV) Iowa strain isolate IGU-12 (VR 2385). Positive plaques were identified using the probe. The primers were also used as sequencing primers to obtain internal sequences. A 2062-bg 3' terminal sequence (AAT14389) of VR 2385 was obtd. that included ORFs 5, 6 and 7 (AAT14330-92) coding for proteins (AAR84701-03) useful in vaccine development
                                                                                                                                                                                                                                                                 New porcine reproductive and respiratory syndrome virus DNA - and proteins encoded by open reading frames of an Iowa strain of the virus; are used in vaccines against PRRSV in pigs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

reproductive and respiratory syndrome virus (PRRSV). The amplified represent amplification primers for ORFs 1b-7 of porcine reproductive and respiratory syndrome virus (PRRSV). The amplified sequences can be used in the polynucleotides of the invention. PRRSV is a new and severe disease in swine, characterised by reproductive failure in sows and guilts, pneumonia in young growing pigs, and an increase in prewearing mortality. However, there are marked diferences in pathogenicity between iolates (with ISU327) being the least virulent solate known). The genomic organisation of PRRSV resembles coronaviruses and toroviruses, in that their replication involves the formation of a 3'-coterminal nested set of subgenomic mRNRs. ORFs 5, 6 and 7 encode a glycosylated membrane protein, an unglycosylated membrane protein, an unglycosylated membrane sascolated proteins. The polynucleotides of the invention, encode a protein that is at least 88*, but less than 100* cheming to me of proteins encoded by one of the ORFs of these sequences. The polynucleotides of the invention, and their encoded polynetides can be used in a vaccine to protect a pig against PRRSV. Antibodies raised against the polypoptides can be used to treat a pig suffering from PRRSV, and to assay for a PRRSV

AAT79997-T80016 represent amplification primers for ORFs 1b-7 of porcine reproductive and respiratory syndrome virus (PRRSV). The amplified repreductive and respiratory syndrome virus (PRRSV). The amplified requences can be used in the polymucleotides of the invention. PRRSV is a new and severe disease in swine, characterised by reproductive failure in sows and guilts, pneumonia in young growing pigs, and an increase in preweating mortality. However, there are marked diferences in pathogenicity between iolates (with ISU392) being the least virulent pathogenicity between iolates (with ISU392) being the least virulent isolate known). The genomic organisation of PRRSV resembles coronaviruses and toroviruses, in that their replication involves the formation of 3; cocterminal nested set of subgenomic mRNAs. ORFS 5, 6, and 7 encode a glycosylated membrane protein, an unglycosylated membrane protein, and succeeding membrane associated proteins. The polymucleotides of characteristics of membrane associated proteins. The polymucleotides of the invention, encode a protein that is at least 88*, but less than 100* homologous to one of proteins encoded by one of the ORPs of these sequences. The polymucleotides of the invention, and their encoded collections raised against the polymetrides can be used in a vaccine to protect a pig against PRSV.

AAT79997-T80016 represent amplification primers for ORFs 1b-7 of porcine reproductive and respiratory syndrome virus (PRRSV). The amplified sequences can be used in the polynucleotides of the invention. PRRSV is a new and severe disease in swine, characterised by reproductive failure in sows and guilts, pneumonia in young growing pigs, and an increase in preweating mortality. However, there are marked diferences in preweating mortality. However, there are marked diferences in preweating mortality. However, there are marked diferences in candon corpusation of PRRSV resembles coronaviruses and toroviruses, in that their replication involves the formation of a 3' coterminal nested set of subgenomic mRNAB. ORFs 5, and 7 encode a coterminal nested set of subgenomic mRNAB. ORFs 5, and 7 encode a coterminal nested set of subgenomic mRNAB. ORFs 5, and 7 encode a coterminal nested set of subgenomic mRNAB. ORFs 5, and 7 encode a concleocapsid protein, an unglycosylated membrane protein, an unglycosylated membrane protein that is at least 88*, but less than 100% the invention, encode a protein that is at least 88*, but less than 100% colypeptides can be used in a vaccine to protect a pig against PRRSV. Antibodies raised against the polypeptides can be used to treat a pig suffering from PRRSV, and to assay for a PRRSV
                                                                                                                                                                                                                                                                                                                                          Porcine reproductive and respiratory syndrome virus; PRRSV; coronavirus; reproductive failure; pneumonia; pig; preweaning mortality; torovirus; subgenomic mRNA; glycosylated membrane protein; nucleocapsid protein; membrane associated protein; vaccine; antibody; therapy; primer; amplify; polymerase chain reaction; PCR; ss.

differentiating a lst strain of porcine reproductive and respiratory differentiating a lst strain of porcine reproductive and respiratory syndrome virus (PRRSV) from a 2nd. The method comprises selecting at least 1 restriction enzyme (RE), which yields a distinctive fragment profile from ORFS cDNA from the lst and 2nd strains, cleaving the cDNA of the lst and 2nd strains and comparing the RE fragment patterns. The method can be used to distinguish PRRSV strains from each other, and field strains from the currently used vaccine strain. It can also be used in epidemiological studies to evaluate the source and transmission of pressive from the ORF s region of the PRRSV genome is sufficiently variable among strains to allow differentiation, while being stable enough to have a low probability of mutational change during repeated in

The present invention describes a nucleic acid which encodes a polymerase from an RNA virus, excluding porcine reproductive and respiratory syndrome virus (PRRSV), and open reading frames (ORFS) 2-7 of PRRSV. The use of a polymerase gene from RNA viruses can provide for production of less mutagenic recombinant viruses. The recombinant viruses can be used in vaccines which have a reduced risk of loss or reduction of efficacy. The vaccines are used particularly for protecting swine againer PRRSV. The high fidelity RNA polymerase gene can be used as a marker that allows organisms vaccinated with such a vaccine to be distinguished from organisms naturally infected with wild type strains of virus or other vaccines. The present sequence represents a PCR primer used in an example
                                                                                                                                                                                                                                                                                           New recombinant porcine reproductive and respiratory syndrome virus -containing nucleic acid encoding a polymerase from an RNA virus and open reading frames 2-7 of the porcine virus, used particularly in vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             porcine reproductive and respiratory syndrome virus; PRRSV; antiviral; immunoprotective; vaccine; ISU-55; porcine reproductive and respiratory disease; PCR; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Porcine reproductive and respiratory syndrome virus PCR primer 2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   DB 1; Length 20;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes a nucleic acid which encodes a polymerase from an RNA virus, excluding porcine reproductive and respiratory syndrome virus (PRRSV), and open reading frames (ORFS) 2-7 of PRRSV. The use of a polymerase gene from RNA viruses can provide for production of less mutagenic recombinant viruses. The recombinant viruses can be used in vaccines which have a reduced risk of loss or reduction of efficacy. The vaccines are used particularly for protecting swine against PRRSV. The high fidelity RNA polymerase gene can be used as a marker that allows organisms vaccineted with such a vaccine to be distinguished from organisms naturally infected with wild type strains of virus or other vaccines. The present sequence represents a PCR primer used in an example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New recombinant porcine reproductive and respiratory syndrome virus -
containing nucleic acid encoding a polymerase from an RNA virus and open
reading frames 2-7 of the porcine virus, used particularly in vaccines.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention relates to novel DNA and polypeptide sequences (ISU-55) of a porcine reproductive and respiratory syndrome virus (PRRSV). The invention may allow development of compounds with antiviral or used to induce activity or a vaccine. The ISU-55 polypeptides can be used to induce antibodies against PRRSV effective to induce the antibodies in a pig. Compositions comprising the ISU-55 polypeptides can be used as vaccines to protect pigs from a porcine reproductive and respiratory disease. The ISU-55 polypeptides can antibodies in pigs.
                                                                                                                  This invention relates to novel DNA and polypeptide sequences (ISU-55) of a porcine reproductive and respiratory syndrome virus (PRRSV). The invention may allow development of compounds with antiviral or immunoprotective activity or a vaccine. The ISU-55 polypeptides can be used to induce antibodies against PRRSV effective to induce the antibodies in a pig. Compositions comprising the ISU-55 polypeptides can be used as vaccines to protect pigs from a porcine reproductive and respiratory disease. The ISU-55 polypeptides can antibodies in pigs.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention relates to novel DNA and polypeptide sequences (ISU-55) of a porcine reproductive and respiratory syndrome virus (PRRSW). The invention may allow development of compounds with antiviral or immunoprotective activity or a vaccine. The ISU-55 polypeptides can be used to induce antibodies against PRRSW effective to induce the autibodies in a pig. Compositions comprising the ISU-55 polypeptides can be used as waccines to protect pigs from a porcine reproductive and respiratory disease. The ISU-55 polypeptides can be used to induce
                                                                                                                                                                                                                                                                                                                                                                                                                                  porcine reproductive and respiratory syndrome virus; PRRSV; antiviral; immunoprotective; vaccine; ISU-55; porcine reproductive and respiratory disease; PCR; primer; 88.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                 This invention relates to novel DNA and polypeptide sequences (ISU-55) of a porcine reproductive and respiratory syndrome virus (PRRSV). The invention may allow development of compounds with antiviral or immunoprotective activity or a vaccine. The ISU-55 polypeptides can be used to induce antibodies against PRRSV effective to induce the antibodies in a pig. Compositions comprising the ISU-55 polypeptides can be used as vaccines to protect pigs from a porcine reproductive and respiratory disease. The ISU-55 polypeptides can antibodies in pigs.
                                                                                                                                                                                                                                                                                                                                                                             Reproductive and Respiratory Syndrome Virus (PRRSV) DNA sequences

The present invention relates to a method of determining the cesuseration virus (PRRSV). This involves assaying for CD 151 in a sample of cellular material of known origin from the animal. In a sample of cellular material of known origin from the animal. In addition, coding sequences of CD 151 are described, and anti-viral compounds designated anti-RNA entry proteins (anti-RRBS). The method is useful for determining susceptibility and resistance to PRRSV in an animal. This is particularly useful for improving swine breeding or for animal. This is particularly useful for improving swine breeding or for developing non-simian recombinant cell lines for propagating the virus, for producing anti-viral compounds or vaccines for inducing immunity against PRRSV, and for diagnosing PRRSV infection in a swine. The present sequence data for this patent did not form part of the printed sequence data for this patent did not form part of the printed affection in a virus, the virus of the printed in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        porcine reproductive and respiratory syndrome virus; PRRSV; susceptibility; CD 151; susceptibility standard; PRRSV infection; vaccine, vaccine virus stock; non-simian vaccine; xenotransplantion; non-simian cell line; drug testing; transformed cell line; porcine; pig; reverse transcriptase PCR; RT-PCR; primer; ss.
                                                                                                                                                                                                                                                                                                                                         Determining susceptibility and resistance to porcine reproductive and respiratory syndrome virus (PRRSV), useful for improving swine breeding, by assaying for CD 151 in a sample of cellular material of known origin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

The invention describes a method to identify susceptibility to porcine reproductive and respiratory syndrome virus (PRRSV) in an animal by assaying a cellular material sample from known origin in the animal for CD 151. The method is useful to determine the susceptibility of animals (especially pigs) to PRRSV and to compare susceptibility to a known corgin. It can be used to determine if an animal is resistant to PRRSV infection, by determining presence/absence of CD 151, and to classify infection, by determining presence/absence of CD 151, and to classify cresistance levels. It is especially useful to select animals for breeding, by selecting animals with CD 151 levels lower (especially a least 50 % lower) than a known standard (especially for material of the same cellular origin). Polymucleotides encoding CD 151 are useful to produce vaccines and to modify PRRSV production in cells susceptible to produce vaccines, avoiding possible introduction of primate viruses into organs, and to RRSV inteduction of primate viruses into organs, avoiding possible introduction of primate viruses into organs. Compare PRRSV susceptibility factors between individual swine. They can especially susful to humans. They may be used to modulate viral RNA (especially PRSV RNA) entry into cells by altering CD 151 amounts in cells. Polymucleotides may be included in plasmids useful to produce non-simian lines for drug testing. They may be included in vectors and used to integrate CD 151 into a chromosome. They can also be used to produce transformed call lines, useful enciped confidence vaccines for inducing immity against PRRSV. This sequence represents a primer used to isolate to manify against PRRSV. This sequence represents a primer used to isolate to both the confidence of the plans of the confidence of the plans of the confidence of the plans of the confidence of the confi
Determination of susceptibility to porcine reproductive and respiratory syndrome virus non-invasively useful e.g. to breed pigs with low susceptibility or classify infection resistance in an animal, by assaying for CD 151.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 20 BP; 2 A; 4 C; 8 G; 6 T; 0 U; 0 Other;

ö

Primer A (AAT16248) is based on positions 2783-2801 of a nucleic acid (see AAT16238) comprising ORFs 2-7 of VR-2332, a strain of the porcine reproductive and respiratory syndrome (PRRS) virus. Primer A' (AAT16249) is based on the inverse complement of positions 3271-3289 of the sequence. The primers were used to amplify ORF 7 (AAT1648) of VR-2332, which encodes a nucleocapsid protein (AAR92515). The PCR product was cloned into vector pET25b and expressed in host cells

Sequence 19 BP; 6 A; 4 C; 4 G; 5 T; 0 U; 0 Other;

Viral DNA from VR-2332 genome ORF 2-ORF 7 region - causes porcine reproductive and respiratory syndrome, useful in vaccines.

The use of a polymerase gene from RNA viruses can provide for production of less mutagenic recombinant viruses. The recombinant viruses can be used in vaccines which have a reduced risk of loss or reduction of efficacy. The vaccines are used particularly for protecting swine against PRRSV. The high fidelity RNA polymerase gene can be used as a marker that allows organisms vaccinated with such a vaccine to be distinguished from organisms naturally infected with wild type strains of virus or other vaccines. The present sequence represents a PCR primer used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New recombinant porcine reproductive and respiratory syndrome virus -
containing nucleic acid encoding a polymerase from an RNA virus and open
reading frames 2-7 of the porcine virus, used particularly in vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Equine arteritis virus; EAV; vaccine; structural gene; PRRSV; porcine reproductive and respiratory syndrome virus; recombinant virus; PCR primer; ss.
                                                                                                                                                                                                                                            Gaps
which encodes a nucleocapsid protein (AAR92515). The PCR product was cloned into vector pET25b and expressed in host cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Porcine reproductive and respiratory syndrome virus PCR primer #2.

differentiating a 1st strain of porcine reproductive and respiratory syndrome virus (PRRSV) from a 2nd. The method comprises selecting at least 1 restriction enzyme (RB), which yields a distinctive fragment profile from ORFS cDNA from the 1st and 2nd strains, cleaving the cDNA of the 1st and 2nd strains and comparing the RB fragment patterns. The method can be used to distinguish PRRSV strains from each other, and field strains from the currently used vaccine strain. It can also be used in epidemiological studies to evaluate the source and transmission of variable among strains. The ORF s region of the PRRSV genome is sufficiently variable among strains to allow differentiation, while being stable enough to have a low probability of mutational change during repeated in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

New porcine respiratory and reproductive disease virus - used to prepare vaccines and antibodies for diagnosis, treatment and prophylaxis of virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Porcine reproductive and respiratory syndrome virus; PRRSV; vaccine; antigen; baculovirus; vector; Hi-Five; insect; polymerase chain reaction;
                                                                                                                                                                                                                                                                                                                                                                                                                                    The sequences given in AAQ63585-90 are primers which were used in the amplification of ORF-5, ORF-6 and ORF-7 of the infectious agent associated with the Iowa strain of porcine respiratory and reproductive syndrome, termed ISU-12. The isolated ISU-12 sequence may be used to infect cells and from these, the vaccine of the invention can be produced. This vaccine may be used for protecting pigs against a porcine respiratory and reproductive disease (PRRD). Antibodies to the vaccine may also be used in treating PRRD and for assaying for the virus. (Updated on 25-MAR-2003 to correct PN field.)

AAT14391) of porcine reproductive and respiratory gradrome virus (PRRSV) Iowa strain isolate ISU-12 (VR 2385). ORF-5 (AAT14390) was amplified using 2 other primers (AAT14398-99) and ORF-7 (AAT14392) using 2 further primers (AAT14402-03). Amplified fragments were cloned into baculovirus transfer vector pVL1393 and used for prodn. of recombinant Iowa strain infectious agent proteins (ORF5-7 products, see also AAR94701-03) in Hi-Pive insect cells. These proteins can be used in subunit vaccines against
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Porcine Reproductive and Respiratory Syndrome Virus (PRRSV) DNA sequences
                                                                                                                                                                      New porcine reproductive and respiratory syndrome virus DNA - and proteins encoded by open reading frames of an Iowa strain of the virus; are used in vaccines against PRRSV in pigs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         porcine reproductive and respiratory syndrome virus; PRRSV; antiviral; immunoprotective; vaccine; ISU-55; porcine reproductive and respiratory disease; PCR; primer; 88.
                                                                                                                                                                                                                                                             2 Primers (AAT14400 and AAT14401) were used to amplify ORF-6 (see also
                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

This involves assaying for CD 151 in addition, coding sequences of CD 151 are described, and anti-viral compounds designated anti-RNA entry proteins (anti-RRSP). The method is useful for determining susceptibility and resistance to PRSV in an animal. This is particularly useful for improving swine breeding or for screening different pig breeding lines. The method is also useful for developing non-simian recombinant call lines for propagating the virus, for producing anti-viral compounds or vaccines for inducing immunity against PRRSV, and for diagnosing PRRSV infection in a swine. The present
                               This invention relates to novel DNA and polypeptide sequences (ISU-55) of a porcine reproductive and respiratory syndrome virus (PRRSV). The invention may allow development of compounds with antiviral or immunoprotective activity or a vaccine. The ISU-55 polypeptides can used to induce antibodies against PRRSV effective to induce the antibodies in a pig. Compositions comprising the ISU-55 polypeptides can be used as vaccines to protect pigs from a porcine reproductive and respiratory disease. The ISU-55 polypeptides can be used to induce
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 selective breeding; xenotransplant; anti-RNA entry protein; anti-REP; anti-viral; vaccine; pCR; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Determining susceptibility and resistance to porcine reproductive and respiratory syndrome virus (PRRSV), useful for improving swine breeding, by assaying for CD 151 in a sample of cellular material of known origin from the animal.

reproductive and respiratory syndrome virus (PRRSV) in an animal by assaying a cellular material sample from known origin in the animal by assaying a cellular material sample from known origin in the animal by copically bigs) to PRRSV and to compare susceptibility of animals susceptibility properties of the same cellular corpus in the same cellular origin. It can be used to determine if an animal is resistant to PRRSV infection, by determining presence/absence of CD 151, and to classify resistance levels. It is especially useful to select animals for breeding, by selecting animals with CD 151 levels lower (especially a breeding, by selecting animals with CD 151 levels lower (especially a classify breeding, by selecting animals with CD 151 levels lower (especially a classify breeding, by selecting animals with CD 151 levels lower (especially to more second classify breeding, by selecting animals with CD 151 levels lower (especially to move the same cellular origin). Polymucleotides encoding CD 151 are useful to produce vaccines and to modify PRRSV production in cells susceptible to PRRSV infection, especially useful to produce non-simian vaccines, avoiding possible introduction of primate viruses into organs avoiding possible introduction of primate viruses into organs
                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               syndrome virus non-invasively useful e.g. to breed pigs with low susceptibility or classify infection resistance in an animal, by assaying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       porcine reproductive and respiratory syndrome virus; PRRSV; susceptibility; CD 151; susceptibility standard; PRRSV infection; susceine; vaccine virus stock; non-simian vaccine; xenotransplantion; non-simian cell line; drug testing; transformed cell line; porcine; reverse transcriptase PCR; RT-PCR; primer; 88.
sequence is a PCR primer used to amplify the PRRSV RNA. Note: The sequence data for this parent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Determination of susceptibility to porcine reproductive and respiratory
